Foundation of Software Engineering

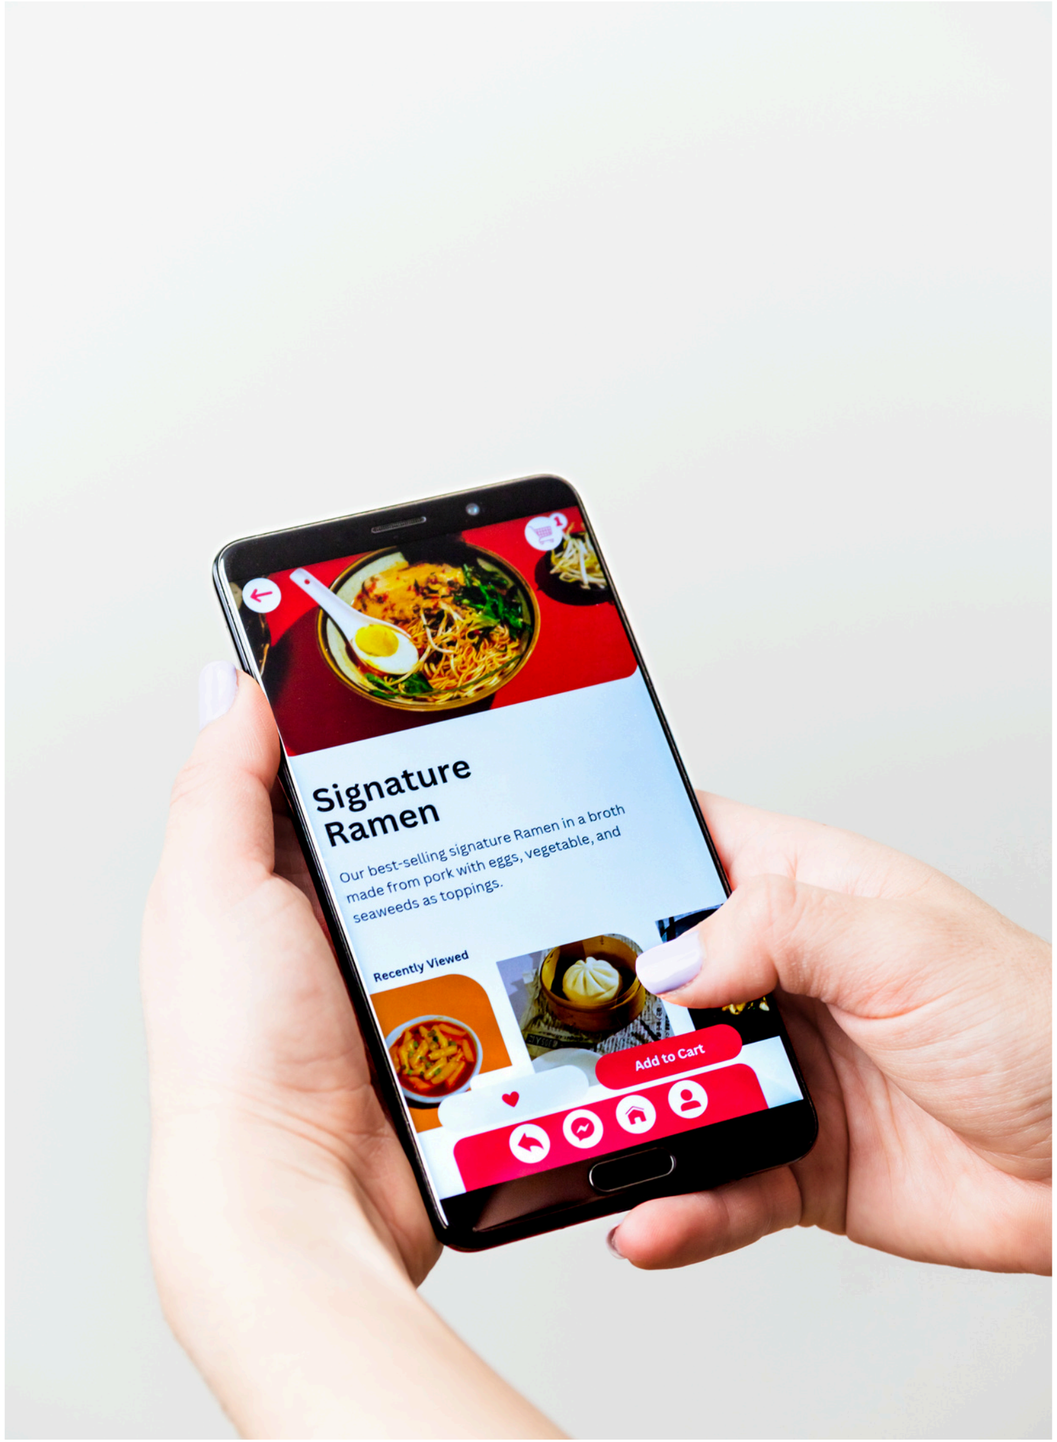

Online Food Delivery System

2026

Introduction

Online food delivery systems have become an important part of daily life because they provide fast and easy food ordering services Customers can browse menus place orders make payments and track deliveries online The Online Food Delivery System aims to improve communication between customers restaurants and delivery drivers while making the ordering process more efficient secure and user friendly

Problem Description

The current food delivery system is semi-manual, which leads to delays, errors, and inefficiency, especially during peak hours. Customers experience slow service, and restaurants struggle with order management. Therefore, an automated food delivery system is needed to improve efficiency, accuracy, and user experience.

Stakeholder

Customer

Delivery Driver

Restaurant Staff

Restaurant Manager

System Administrator

Roles & Interaction

- **Customer**

Browses restaurants and menus, places orders, makes payments, tracks order status, and may cancel orders or provide ratings.

- **Restaurant**

Receives orders, manages menu items, and prepares food according to incoming requests.

- **Delivery Driver**

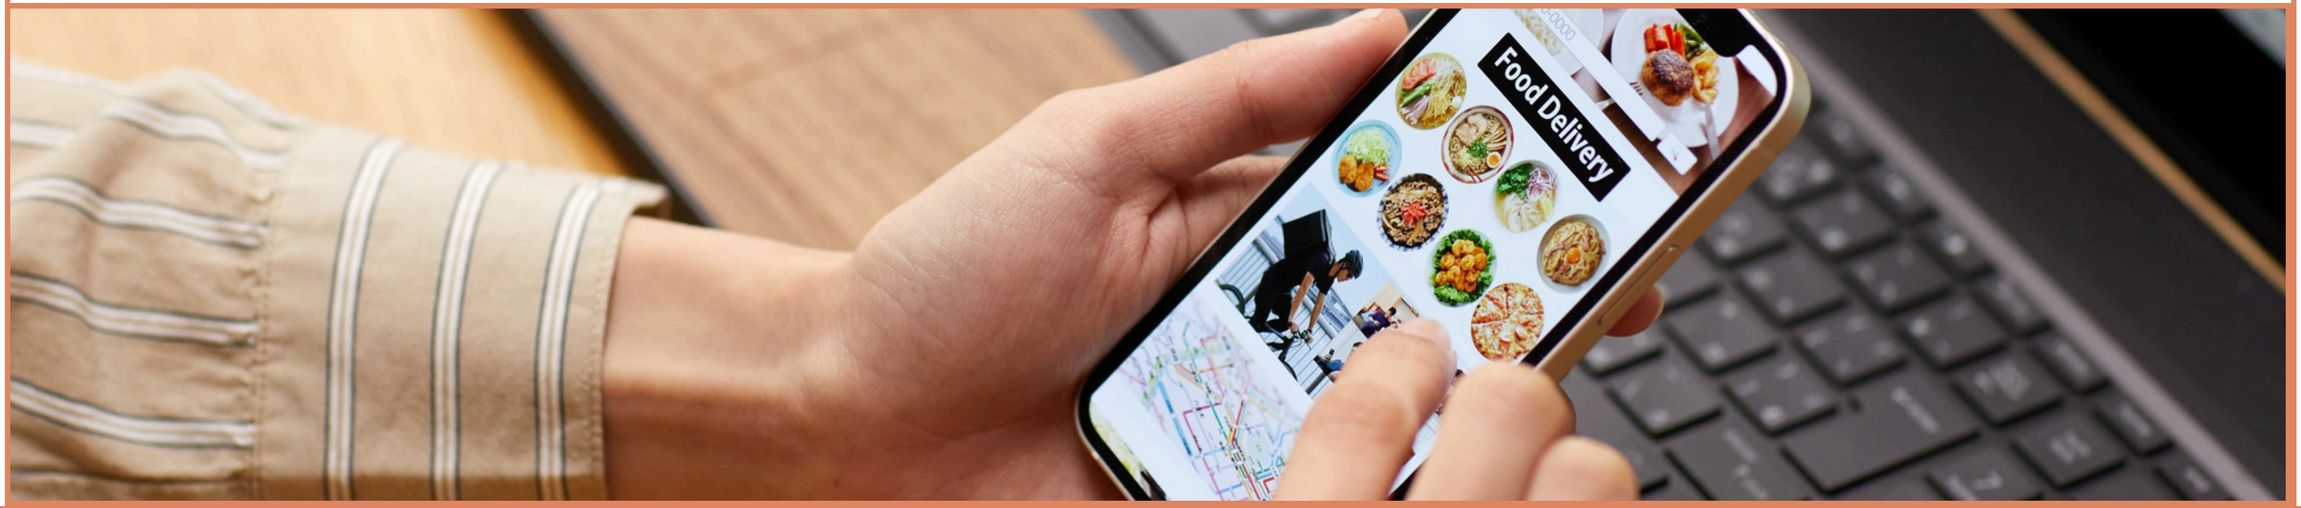

Accepts delivery tasks, delivers orders to customers, and updates delivery status in the system.

- **System Administrator**

Monitors system performance, manages user accounts, handles complaints, and analyzes system data to improve efficiency and service quality.

Functional Requirements

- User Registration and Login
- Browse Restaurants and Menu
- Order Food
- Order Tracking
- Payment Processing
- Order Cancellation and Ratings

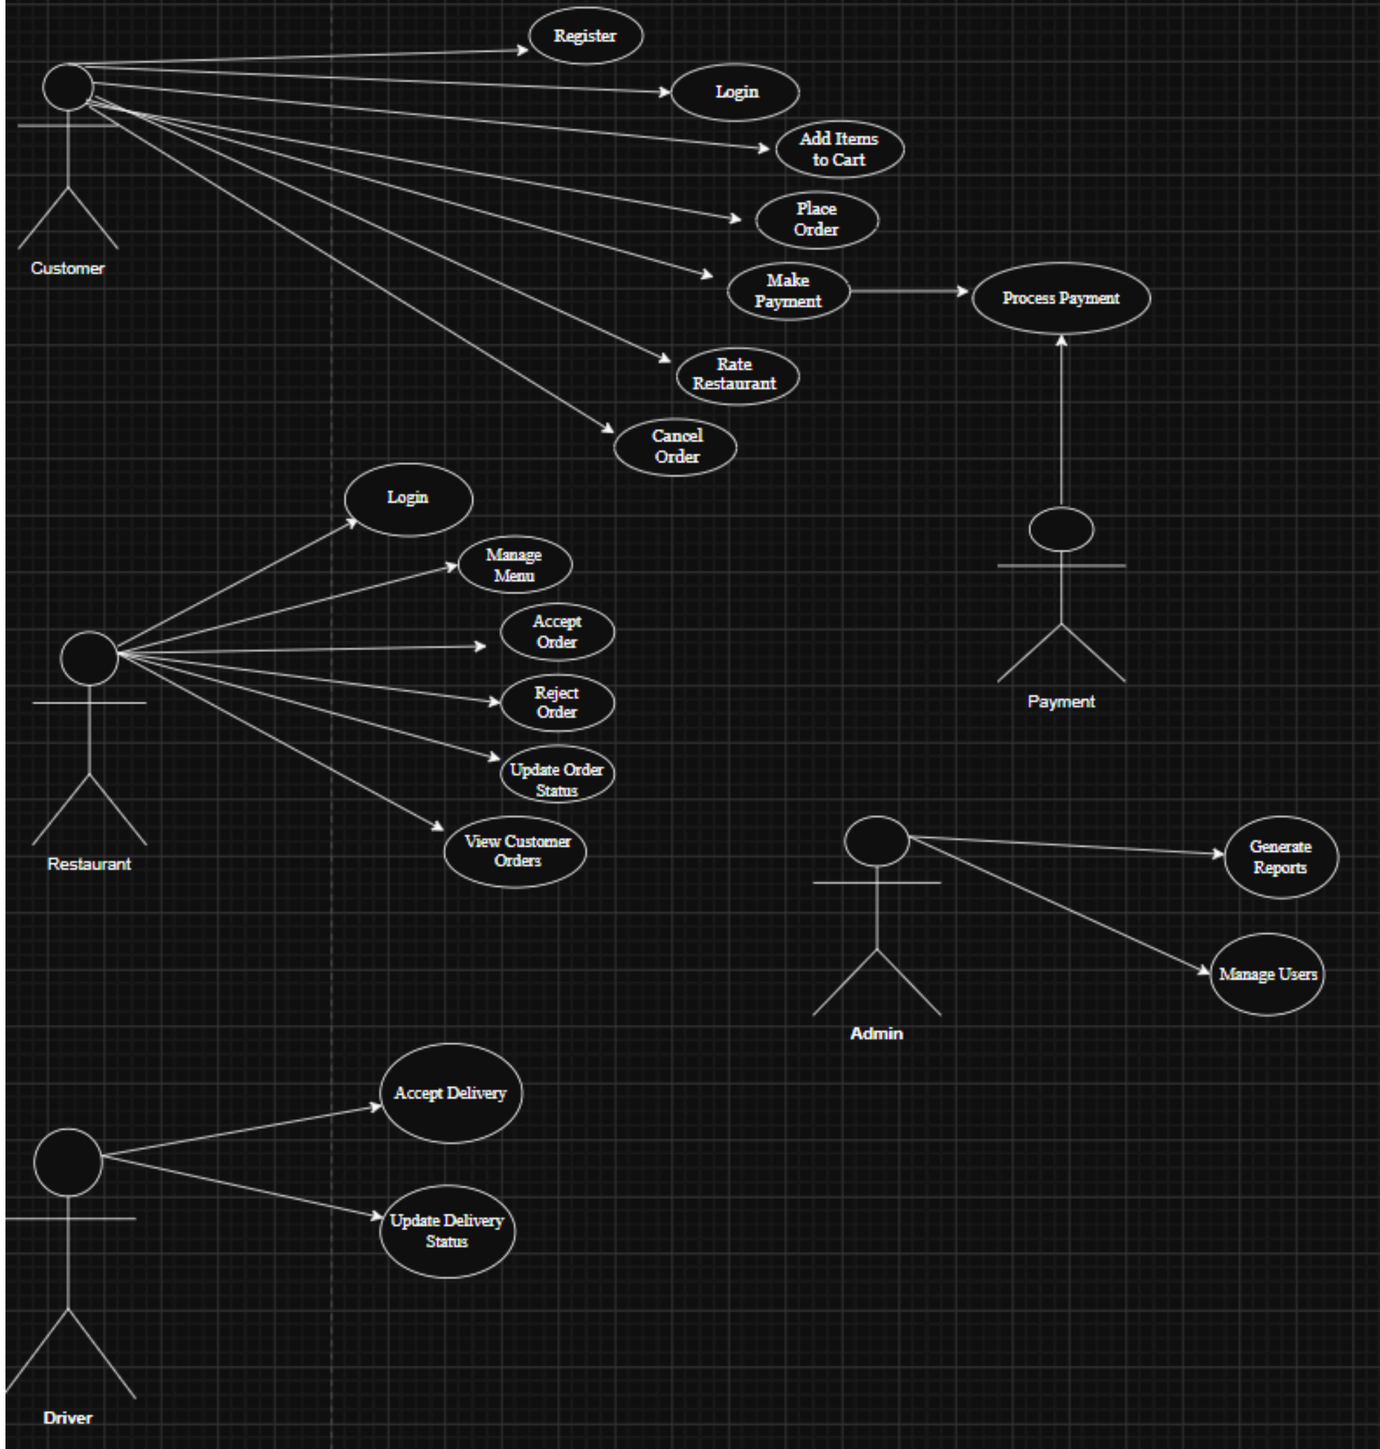

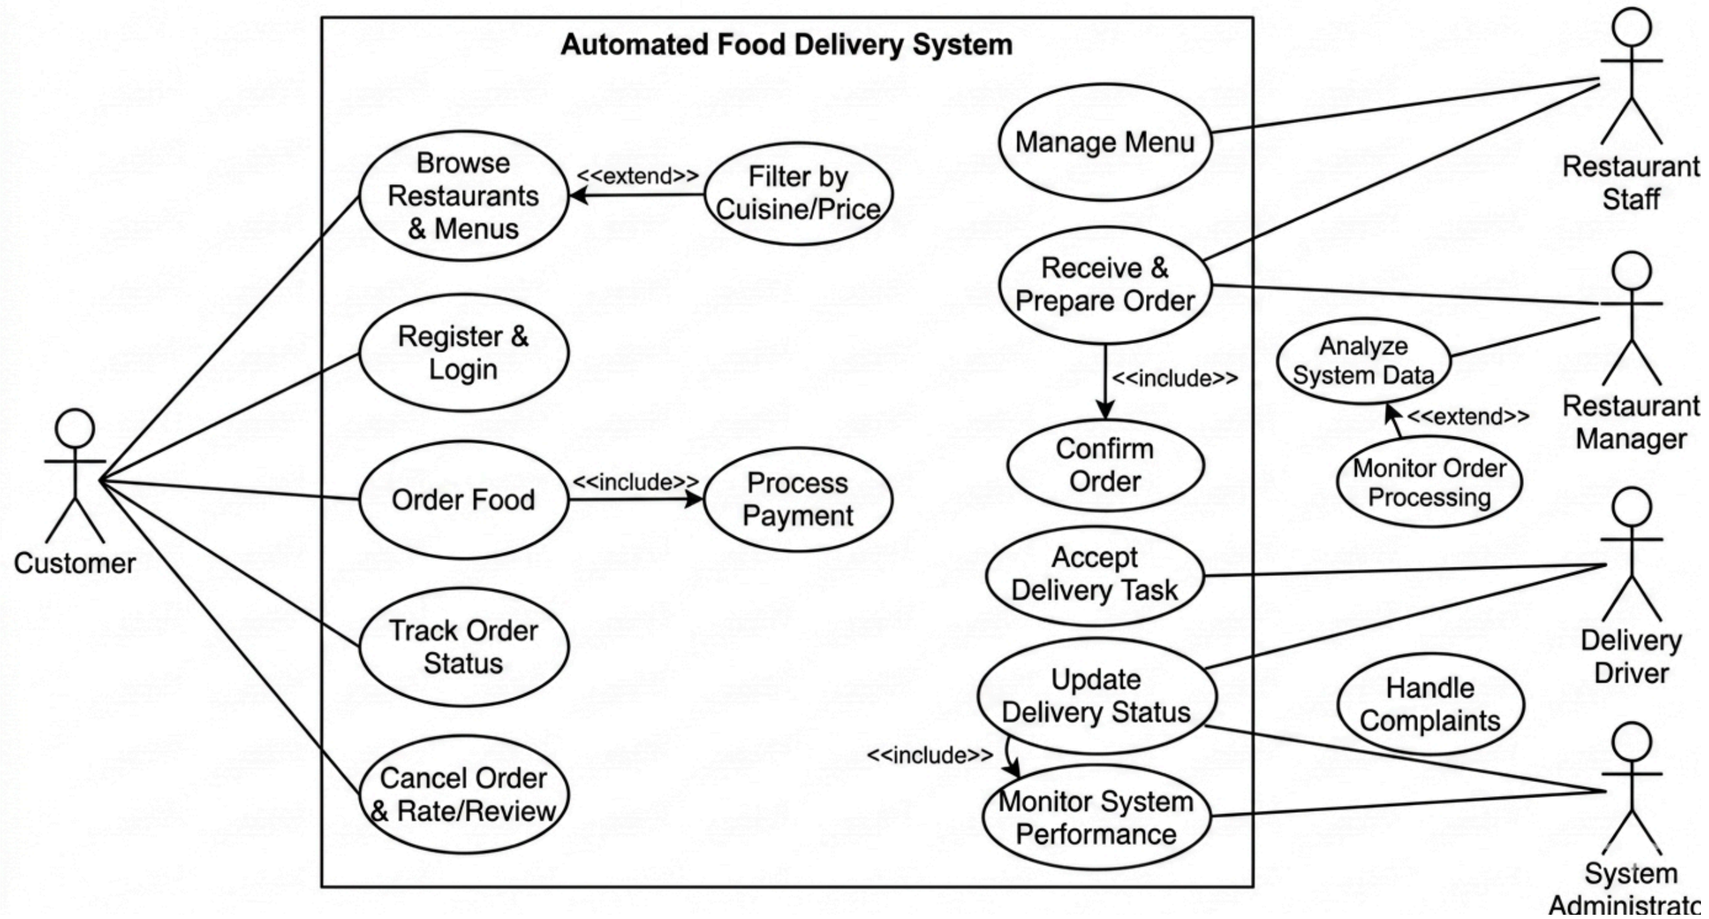

Non-Functional Requirements

- Performance
- Security
- Usability
- Reliability & Availability
